

Copied for you:

```
typedef struct {
    int is_integer;
    union {
        int i;
        float f;
    };
} data_t;

// Takes in data and returns double its int or
// 0 if it contains a float
int double_or_nothing(data_t *data)
{
    // TODO
}
```

1. Look at the testing code for P1 – Linked Lists in `main.c`. Sketch both the CR and AD lists as a sequence of cons cells.
